

1 Summary

Six invented sampling points along an invented river, each visited twice.
The water was clearer on the second visit at four of the six.

2 The sites

Two points above the weir, two beside the old mill and two below the bridge.
Every site name here is made up for this sample.

3 Readings

Clarity, temperature and a simple nitrate strip at each point.

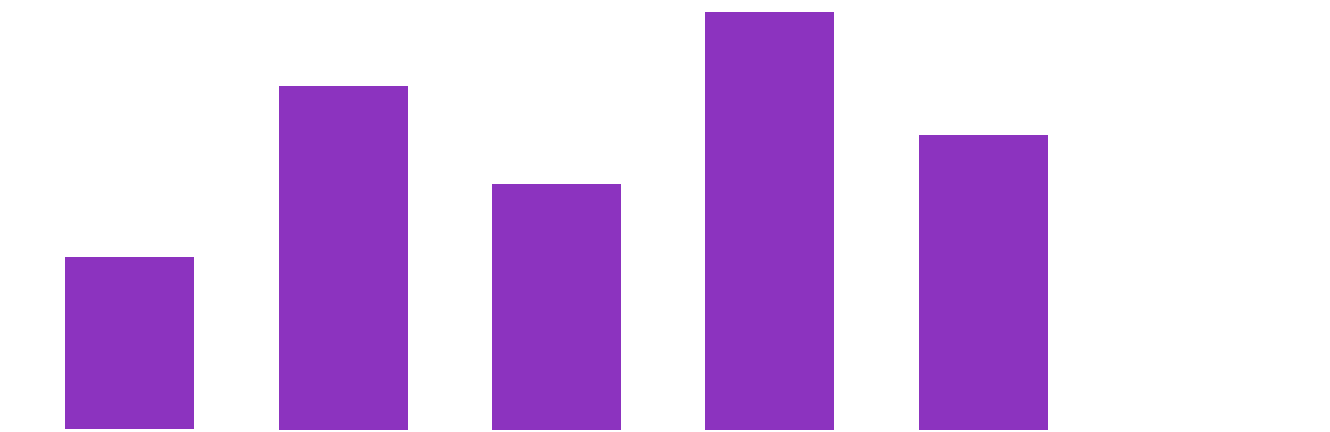

The chart shows clarity on each visit, in invented units.

4

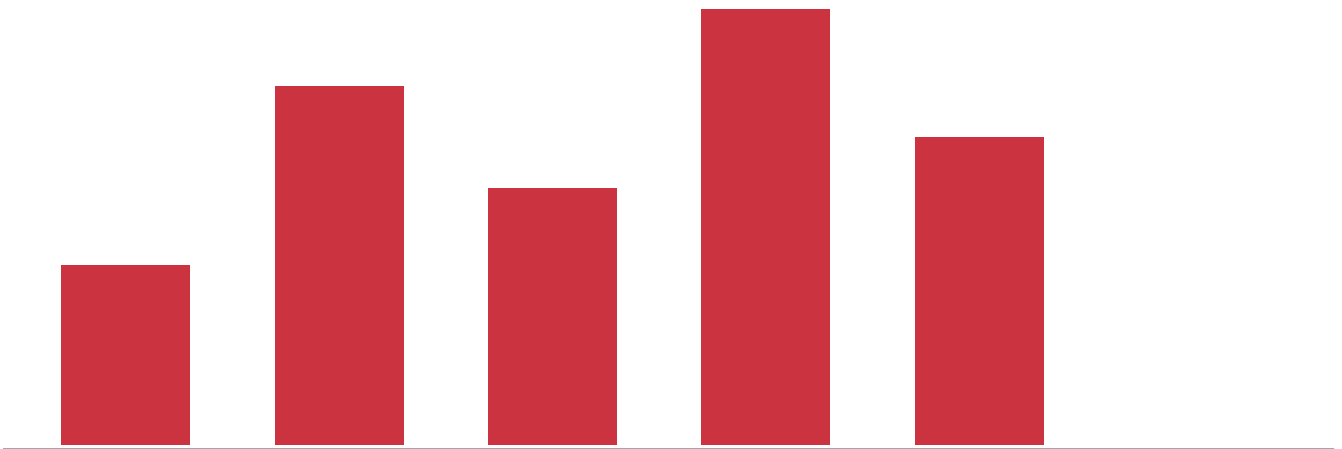

Rainfall

A dry month before the first visit and a wet week before the second.
Rain washes more soil in, and then clears it out again.

5 What changed

The mill points improved the most; the bridge points the least.
Nothing in this report describes a real river or a real survey.

6

Next steps

Visit again after the monsoon and add two points upstream.
Keep the same strips so the numbers can be compared.
